

The challenges of window automation...

Ugly with minimal functionality

There are few options in the marketplace for power, automated casement windows. Typically, they mount on the bottom sill of the window as eyesores for the homeowner and do not lock automatically.

Complicated to sync & install

The “Internet of Things” revolution has enabled homeowners to easily install and automate blinds, locks, lights and heating. The window industry has not kept pace except for complex, European companies that focus on vent windows in commercial applications.

Expensive

Automatic window hardware is typically the same price as the window itself, beyond the reach of most homeowners.

Visionar's solution

Fits inside the window frame to highlight the window, not the hardware.

Simple to install & operate, and links easily to Smart Home Apps.

Similar in price to conventional window-opening hardware.
